

Decode the Chart

Name: _____ Roll No: _____

For each chart below, answer: What is it trying to tell you? Do you trust it? Why or why not?

Chart 1

Market Share by Product (12 categories)

Chart 2

Chart 3

Chart 4

Your notes:

SESSION 1. ACTIVITY - STUDENT HANDOUT

Reg: 192424278

① Regional Comparison - Q2 2025 ~ Chart 1

(*) What is it trying to tell you?

It compares regional attendance percentage across four cities (Madurai, Pune, Jaipur and Indore), visually large differences in performance between regions.

(*) Do you Trust it? NO

(*) Why or why not?

The y-axis starts around 440 instead of 0, which makes the difference between the regions looks much larger than the actually are. Mathematically invalid for percentage metric (which cannot exceed 100%).

② Market Share by product

(*) What is it trying to tell you?

It shows how the total market share is divided among 12 different product categories

(*) Do you trust it? NO

(*) Why or why not?

The pie chart shows proportions, but with 12 categories and similarly sized slices, it is difficult to compare the exact market shares

Chart 3 - Ice Cream Sales vs Drowning incidents

(*) What is it trying to tell you?

Both ice cream sales and drowning incidents appear to increase over the same time period.

(*) Do you trust it? No

(*) Why or why not?

Not as evidence that one causes the other. The chart shows a correlation, but it does not prove that buying ice cream causes drowning. A third factor, such as hot/summer weather could increase both buying ice cream causes drowning. ~~A third factor~~

Chart 4 - coffee cups/day vs Typing speed (WPM)

(*) What is it trying to tell you?

It examines whether the number of coffee cups consumed per day is related to typing speed in words per minute (WPM)

(*) Do you trust it? NO

(*) Why or why not?

- The data forms a completely random scatter could be centered around 50 cups/day and 50 WPM with no clear line or pattern, demonstrating zero correlation between the two variables

- The x-axis values are unrealistic (e.g., people drinking 30 to 100 cups of coffee per day), indicating synthetic, implausible or extreme outlier data
